There are billions of devices in homes, factories, oil wells, hospitals, cars, and thousands of other places. With the proliferation of devices, you increasingly need solutions to connect them, and collect, store, and analyze device data. AWS IoT provides broad and deep functionality, spanning the edge to the cloud, so you can build IoT solutions for virtually any use case across a wide range of devices. This session will explore customer use cases and dive deep into some of these core IoT services in the cloud and at the edge.

As an IoT Specialist Solutions Architect for AWS Public Sector, Chris Azer is responsible for supporting federal and state government agencies and partners with their IoT initiatives. With over 15 years of experience, it has been his main goal to help customers extract value from connected devices within the public sector community and industrial automation. Today, Chris helps his customers improve quality of life for populations, business operations, quality of care from service providers, environmental sustainability, and host of other use case scenarios.
